Effective Date: 7-1-2026

Description/Title:

Improvement to the housing for the ATX Series Drivers

Comments:

When the ATX Series Drivers were introduced a little over 3 years ago (See PB464), they used a unique ESD-Safe resin for the housing. Over the years, we've been working to improve the durability, performance, and grip for the housing in addition to the other customer-requested improvements we implemented earlier this year (See PB519).

The housing of the ATX Series Drivers will now be made of aluminum featuring an ESD-Safe red powder coating. The thermoplastic rubber (TPR) grip area has been increased so the operator has a more comfortable hold of the driver, and the start lever is now a silver-plate resin for contrast with the grip. The LED work light skirt has been improved to strengthen the area around the transducer and housing, further enhancing the driver's accuracy and repeatability. Lastly, the reverse button on the driver is now recessed to reduce accidental activation when the driver is set down on a work surface.

These improvements will begin to appear, starting with the ATX-30, and will appear in the ATX-12 and ATX-50 as we cycle through our inventory this year.

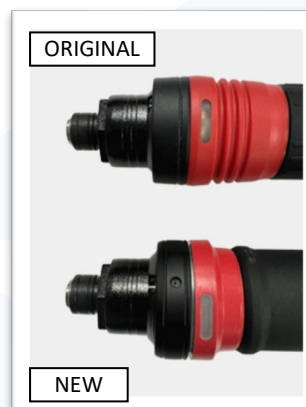

Part No:

ATX-12, ATX-30, ATX-50

Specification:

Weight changed from 480g to 560g.
All other specifications are unchanged
